

## ABSTRACT OF THE DISCLOSURE

A device and method that enables Internet communication products equipped with Web linkage functions to have the functions of a voice mailbox available only in general telecommunication systems or voice telephones through the multimedia service of the Internet. The invention uses the sound recording, playing functions and Internet communication of Internet communication products to turn voice data recorded and receiver's data into a voice message packet which is then sent to a Web server for storage, so that voice message can be retrieved from the voice mailbox when receiver's Internet communication products are linked to the Web server by Internet, to receive and send voice mail as well as use the voice mailbox.
